

Take full control of your data with Corepoint Integration Engine

Action Points

Timely decisions are critical in patient care. Use the data passing through Corepoint Integration Engine to quickly deliver custom, data-triggered alerts via email, text, and/or pager.

DICOM Gear

Convert DICOM header information to HL7, which can be entered as an order in the RIS. Automating the order-entry process reduces errors and simplifies workflows.

Direct Project

Direct Project is a simplified method to externally share data in a variety of formats including C-CDA. Meet Meaningful Use requirements and quickly transmit health data externally.

Failover

Ensure the continuity of patient data flow. Assured Availability and Disaster Recovery extensions remove the uncertainties of planned and unplanned system outages by processing patient data on designated backup servers, automatically.

FTP Gear

Expand data flow capability to send files, specify a time interval, or download messages on request when a VPN is not available.

File Gear

Read or write files containing important clinical health care information such as HL7 data, XML files, HL7 batch files, and more.

Web Services

Securely send and receive data with modern RESTful- and SOAP-based web services and create the most common data exchange scenarios used in HIEs and Accountable Care Organizations.

Professional Services

Corepoint Health's Professional Services team is available to help with your health IT or workflow initiatives. We offer a complete range of services that help healthcare providers easily implement

integration systems and manage patient data flow. Learn more at www.corepointhealth.com/services or contact us at sales@corepointhealth.com or 214-618-7000.
